## Features &amp; Benefits

- ▶ **Wide 3 phase input range** for various AC power systems
- ▶ **Boost current with typically 150% for 5s** supports start-up into capacitive loads
- ▶ **Parallel mode switch** to activate load balancing behaviour
- ▶ **Two means of transient protection** increase process stability
- ▶ **Fast OVP control** protects sensitive loads
- ▶ **Very low inrush energy peak (I<sup>2</sup>t)** saves cost for input line protection
- ▶ **Screw or push-in terminals available** to serve individual connection needs
- ▶ **High efficiency and low stand-by losses contribute to an eco-friendly energy footprint**
- ▶ **DC-OK and inhibit relay contacts** for professional integration into applications control architecture
- ▶ Designed to meet the 7 most accepted IEC safety standards
- ▶ Exceeds regulatory EMC standards on radiated emission (Class B), surge immunity and fast transients

## Accessories

### DBM buffer modules

In order to secure process uptime and reliability in 24V low-voltage systems, DBM buffer modules increase hold-up time or provide a reserve for peak loads.

#### DBM20

20A input/output, electrolytic capacitors, signalling & control, screw terminals

#### DBM20/E

20A input/output, electrolytic capacitors, signalling & control, spring clamp terminals

[emea.lambda.tdk.com/uk/products/dbm20](http://emea.lambda.tdk.com/uk/products/dbm20)

### DRM redundancy modules

For building fault tolerant 12/24V systems, DRM redundancy modules can be used to decouple n+1 power supplies.

#### DRM40

40A output, 2x20A input, screw terminals, DC OK and balancing LEDs

#### DRM40B

40A output, 2x20A input, screw terminals

[emea.lambda.tdk.com/uk/products/drm40](http://emea.lambda.tdk.com/uk/products/drm40)

### DDA DC/DC converter

Non-isolated step-down converter for creating additional DC bus voltages from a single DC input source.

#### DDA250

Single output 20A at 3.3..15V, input 9..53V, DC OK LED, screw terminals

#### DDA325

Dual output 14A at 3.3..24V and 8A at -3.3..-24V, input 9..40V, DC OK LEDs, screw terminals

#### DDA500

Dual output 2x20A at 3.3..15V, input 9..53V, DC OK LEDs, screw terminals

## List of abbreviations

<b>avg.</b>	<i>average</i>	The arithmetic average calculated from a row of values.
<b>CC</b>		Constant output current
<b>CGD</b>		Corner grounded delta (AC power system)
<b>chap.</b>		Chapter
<b>Dir.</b>		Directive
<b>eCap</b>		Electrolytic capacitor
<b>EMC</b>		Electromagnetic Compatibility
<b>Iac</b>		AC input current under a particular operating condition
<b>Iout</b>		DC output current under a particular operating condition
<b>Iout_boost</b>		Available current reserve beyond Iout_nom (w/o a drop in Uset) that can be delivered for a limited time.
<b>Iout_nom</b>		Continuous nominal DC output current under STC.
<b>Iout_ol</b>		Max. intermittent DC output current in an overload situation and a shortfall of Uset.
<b>Iout_sc</b>		Max. short circuit DC output current and Uout < 20% Uout_nom
<b>ITU</b>		International Telecommunication Union
<b>max.</b>	<i>maximum</i>	The maximum value which a parameter can assume, or which must not be exceeded.
<b>MCB</b>		Miniature circuit breaker
<b>min.</b>	<i>minimum</i>	The minimum value which a parameter can assume, or must not be fallen below.
<b>MTBF</b>		Mean Time Between Failure
<b>nom.</b>	<i>nominal</i>	The ideal or reference value of a technical parameter which is guaranteed under STC. All nominal values in this document refer to each other and represent the general specification of the device.
<b>OCP</b>		Overcurrent protection
<b>OTP</b>		Overtemperature protection
<b>OVP</b>		Overvoltage protection
<b>PELV</b>		Protective Extra Low Voltage
<b>Pout_boost</b>		Available power reserve beyond Pout_nom that can be delivered for a limited time.
<b>Pout_nom</b>		Nominal output power
<b>PSU</b>		Power supply unit
<b>Reg.</b>		Regulation
<b>SELV</b>		Safety Extra Low Voltage
<b>STC</b>		Standard test conditions (see „1. General“)
<b>typ.</b>	<i>typical</i>	The typical value of a parameter is not guaranteed but can be assumed under STC. The min. or max. value must be determined during the engineering process of the end application.
<b>Uout</b>		DC output voltage under a particular operating condition
<b>Uout_nom</b>		Nominal DC output voltage
<b>Uset</b>		Manually set output voltage via voltage potentiometer
<b>UVP</b>		Undervoltage protection
<b>/</b>		Separator between two values. The conditions to which the values refer can be found in the last column of the table.
<b>..</b>		Specifies a range of values.

## Table data structure

### X. Technical category

Technical parameter	Characteristic (optional)	Values	Condition (optional)
---------------------	---------------------------	--------	----------------------

## 1. General

### 1.1 Proper handling of the product

The faultless and safe operation of the products requires proper transport, proper storage, set-up, assembly, installation, commissioning, operation and maintenance. The permissible ambient conditions must be observed. Instructions in the associated documentation must be observed.

### 1.2 Protection enclosure required

The device must be installed in a protective housing or control cabinet to which only qualified personnel have access.

### 1.3 Humid environments

Do not operate the device in a damp environment or in an environment where condensation is likely to occur.

### 1.4 Switch or circuit-breaker mounting position

A switch or circuit-breaker must be mounted near the equipment.

### 1.5 Observe country-specific regulations

In addition to the product documentation, the relevant country-specific regulations for the installation of the device must be observed.

### 1.6 Prohibited electrical/mechanical modifications

The product must not be modified in any way electrically or mechanically. Modifications can result in fatal injuries and damage to property.

### 1.7 Expiry of the manufacturer's warranty

The power supply is maintenance-free. Repairs can only be carried out by the manufacturer. Opening the housing voids the manufacturer's warranty.

### 1.8 Use of third-party products

If third-party products and components are used for power or voltage increase, buffering (AC or DC side), EMC filtering, redundancies or for DC side load protection, it must be in accordance with the TDK-Lambda product specification.

### 1.9 Standard test conditions

Unless otherwise stated, all values are specified in normal mounting position (see Fig. 16), at full load, nominal input and output voltages, 25°C (131°F) ambient temperature and a run-in time of 5 minutes.

## 13.3 HIPOT test

Apart from routine and type test, the end user might need to check the insulation strength during the final inspection and testing to guarantee the electrical safety of the end application. Therefore, a high-voltage test (HIPOT test) can be performed in the field. The following conditions must be observed:

- ▶ As every HIPOT test causes stress on the power supplies safety insulation, avoid frequent HIPOT testing or excessive test voltages
- ▶ The test voltages and durations, as indicated under „13.2 Insulation strength“, must not be exceeded
- ▶ The test voltages rise and fall time should be between 2 and 4 seconds
- ▶ For the HIPOT test of the insulation path (B) between Input and PE, the gas discharge tube (GDT) must be disconnected

### Disconnection of the GDT:

- 1) Completely remove the connection screw (marked with an arrow) with a Torx X10. (see Fig. 32)
- 2) Keep the screw in a safe place.
- 3) After completion of testing, reconnect the GDT only with the original screw to avoid risk of electrical shock or damage.

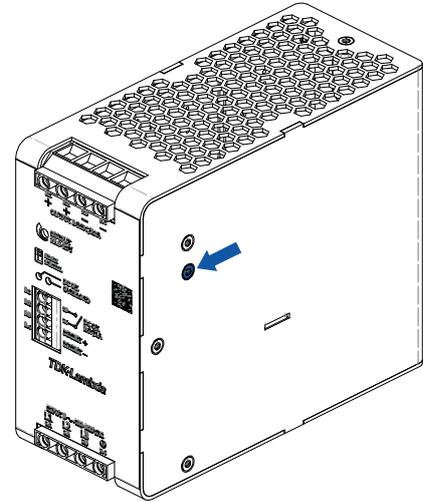

Fig. 32: Position of the connection screw for the GDT

- i** According to EN 60204-1 (Safety of machinery - Electrical equipment of machines), an individual HIPOT test of the power supply isn't required. During the HIPOT test of the end application, the power supply can be disconnected and only installed once the test has been completed.

<sup>3)</sup> Except for the ITU broadcast frequency bands 47 .. 68MHz, where the level shall be 3V.

### Performance level definitions:

#### Criterion A:

The device continues operation as intended during and after the test. The specified performance level accepts a change of ±10% on nominal output voltage and current. There is neither a violation of the performance level, nor a loss of function if the device is used as intended.

#### Criterion B:

The device continues operation as intended after the test. The specified performance level accepts a change of ±10% on nominal output voltage and current. There is neither a violation of the performance level, nor a loss of function if the device is used as intended. During the test a violation of the performance level is allowed.

#### Criterion C:

A temporary loss of function is allowed, provided the function is auto-recoverable, or can be restored by the operation of the controls.

## 15. Electromagnetic emission

## 18. Compliance & Registration

	Conformity with health, safety, and environmental protection standards for products sold within the European Economic Area (EEA).
	UKCA (UK Conformity Assessed) is the product marking that is used for certain goods being placed on the United Kingdom market.
	Registration mark to indicate products conformity to the technical regulations of the Eurasian Customs Union (Russia, Belarus, Armenia, Kazakhstan and Kyrgyzstan).
	The Waste Electrical and Electronic Equipment Directive (WEEE Directive) is the European Community Directive 2012/19/EU on collection, recycling and recovery targets for all types of electrical goods.
	The Restriction of Hazardous Substances Directive 2011/65/EU (RoHS 2) regulates the use of certain hazardous substances in electrical and electronic equipment.
	Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) is a European Union regulation that addresses the production and use of chemical substances, and their potential impacts on both human health and the environment.

Unless otherwise stated, all values are specified in normal mounting position, at full load, nominal input and output voltages, 25°C (77°F) ambient temperature and a run-in time of 5 minutes.

## 19. Typical use-cases

### 19.1 Parallel Operation

For the purpose of power increase, power supplies can be paralleled. The following measures must be taken into account:

- ▶ Only power supplies of the same series and power rating must be paralleled
- ▶ The dip switch on the front side of the power supplies must be switched to PARALLEL
- ▶ Load wiring shall be identical in terms of length and cross section
- ▶ The output voltage of the power supplies shall be adjusted to the same value ( $\pm 100\text{mV}$ )
- ▶ All paralleled power supplies must be operated under the same ambient conditions
- ▶ The power supplies must not be operated under any condition which requires a power derating (e.g. altitudes above 3000mASL (9842ftASL), temperatures above  $55^\circ\text{C}_{\text{amb}}$  ( $131^\circ\text{F}_{\text{amb}}$ ), mounting orientations other than the normal mounting position, etc.)
- ▶ If more than three power supplies are paralleled, each output must be protected by a decoupling module (e.g. TDK-Lambda DRM series), MCB, diode, or fuse
- ▶ The increased installation clearances must be considered (see „8. Installation clearances“)

**i** In parallel operations the values of output load regulation, inrush currents, EMI, harmonic and leakage currents will increase.

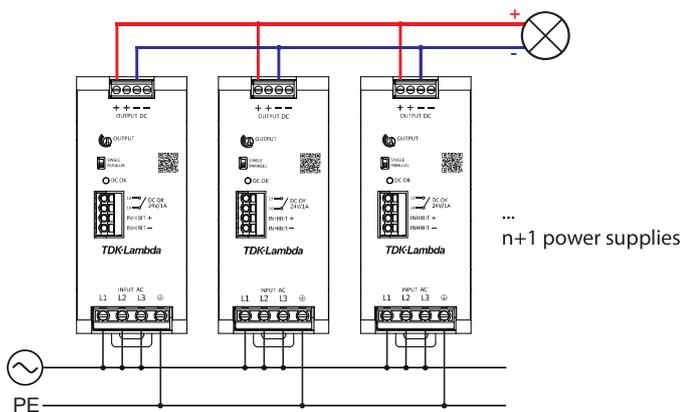

Fig. 33: Connection scheme of n+1 power supplies paralleled for the purpose of power increase

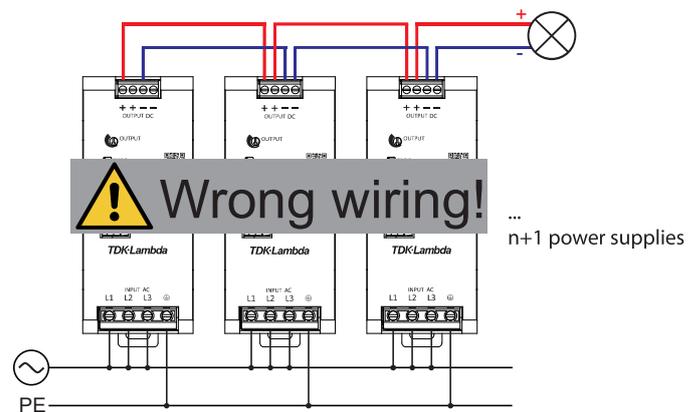

Fig. 34: Example of a wrong connection scheme

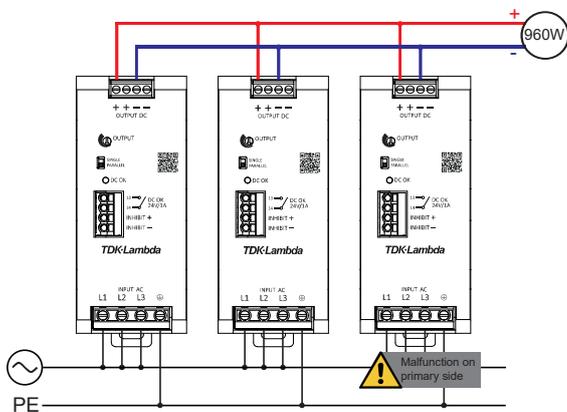

Fig. 35: Connection scheme of n+1 power supplies paralleled for the purpose of a 960W limited redundancy

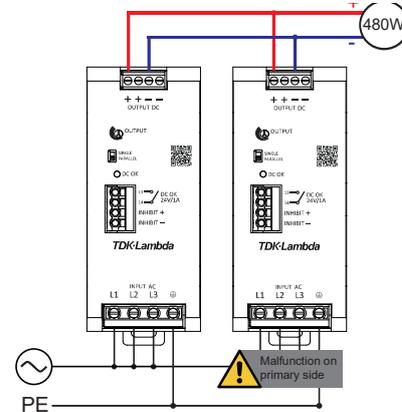

Fig. 36: Connection scheme of 1+1 power supplies paralleled for the purpose of a 480W limited redundancy

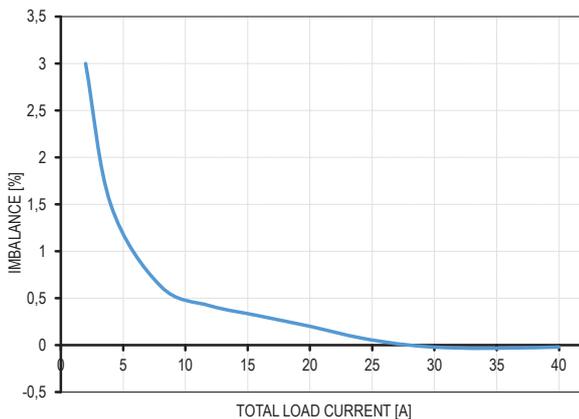

Fig. 37: Typical load sharing behaviour of two power supplies in parallel mode

Unless otherwise stated, all values are specified in normal mounting position, at full load, nominal input and output voltages,  $25^\circ\text{C}$  ( $77^\circ\text{F}$ ) ambient temperature and a run-in time of 5 minutes.

## 19.2 Series operation

For the purpose of higher load voltages, power supplies can be connected in series. The following measures must be taken into account:

- ▶ The output voltage sum must not exceed 250V<sub>DC</sub>
- ▶ Not more than 20 units must be connected in series
- ▶ If the output voltage sum exceeds 60V<sub>DC</sub>, a safeguard against unintended touching must be considered
- ▶ Only power supplies of the same series and power rating must be connected in series
- ▶ The dip switch on the front side of the power supplies must be switched to SINGLE
- ▶ All power supplies in series must be operated under the same ambient conditions
- ▶ The power supplies must not be operated under any condition which requires a power derating (e.g. altitudes above 3000mASL (9842ftASL), temperatures above 55°C<sub>amb</sub> (131°F<sub>amb</sub>), mounting orientations others than the normal mounting position, etc.)
- ▶ The increased installation clearances must be considered (see „8. Installation clearances“)

 In series operations the values of output load regulation, inrush currents, EMI, harmonic and leakage currents will increase.

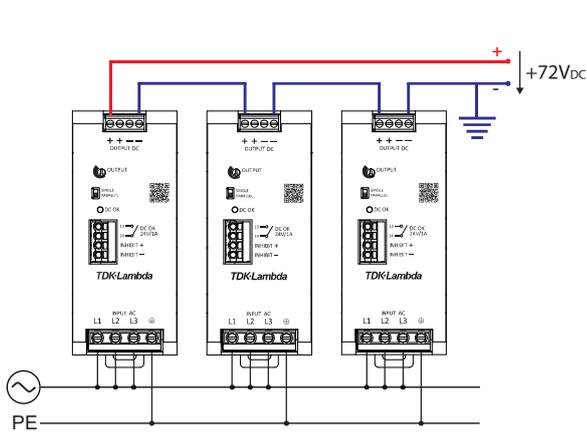

Fig. 38: Connection scheme for series operation with positive voltage level

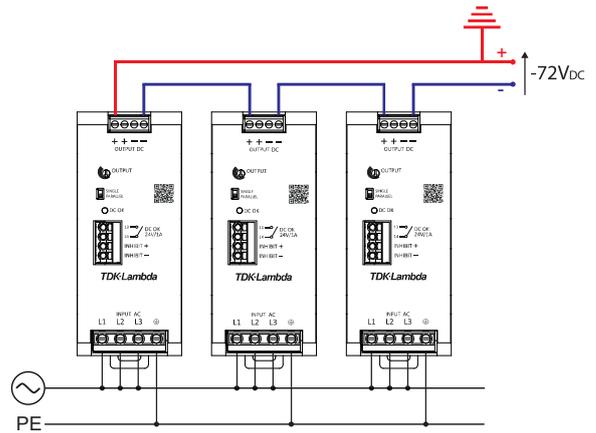

Fig. 39: Connection scheme for series operation with negative voltage level

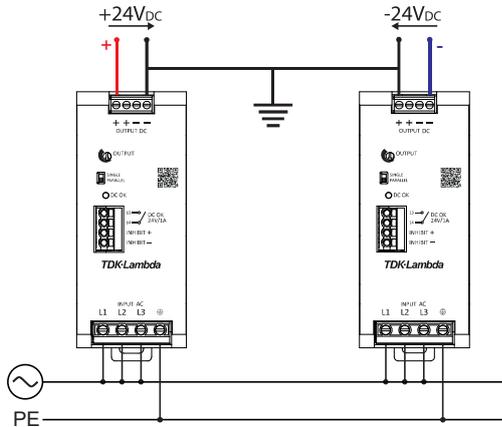

Fig. 40: Connection scheme for series operation with centre tap

## 19.3 Two-phase operation

The device is capable to run continuously on two phases of a 3-phase power grid. A power derating of min. 50% is required under nominal conditions. All conditions associated with a power derating must be carefully considered.

Please note if running on two phases:

- ▶ Power losses will increase and can no longer be guaranteed as specified for 3-phase operation
- ▶ Hold-up times as specified for 3-phase operation can no longer be guaranteed
- ▶ The device will go into OTP mode if operating permanently at input voltages below 350V<sub>AC</sub>
- ▶ The device is no more compliant with IEC/EN 61000-3-2 harmonic current limits
- ▶ Safety approvals under UL 61010-1, -2-201 and UL 62368-1 (Ed.2) are no more applicable
